Chapter 1

Vector Spaces

Next Exam: April 2nd. Covers 4.6→5.1.

1.1 Bases

1.1.1 Determining a Basis

A set S that forms a basis for a vector space V must satisfy two conditions:

1. S is set of linearly independent vectors.
2. S spans V .

All bases for a given vector space V have the same number of elements, and this is referred to as the *dimension* of V such that $\dim[V] =$ the number of elements in the basis.

If the dimension is known, it is equal to the minimum number of vectors needed to span V , as well as the maximum number of linearly independent vectors that a set in V can contain.

Does a set S form a basis for a vector space V ?

First, check for linear independence. If $\dim[V]=n$ and S contains n linearly independent vectors, S is guaranteed to form a basis for V .

Note: $\dim[P_n] = n + 1$.

For the subspaces of a given matrix

Null space:

Suppose we are given a matrix, and want to examine the properties of its null space. Recall that the null space is given by $\{\mathbf{x} : A\mathbf{x} = \mathbf{0}\}$

This is generally found by augmenting the matrix with $\mathbf{0}$ is using ERO to obtain its REF. Once a relationship between the free variables is found, construct a solution set of the form

$$S = \{\mathbf{x} \in \mathbb{R}^n : x = a_1\mathbf{v}_1 + a_2\mathbf{v}_2 \cdots a_n\mathbf{v}_n \wedge a_1, a_2, \cdots a_n \in R\} = \text{span}\{\text{something}\}$$

At this point, it should be clear what the basis and dimensions are.

Row space:

A basis for the row space of a matrix A is nothing more than the number of nonzero rows in $\text{ref}(A)$, which is a subspace of \mathbb{R}^n .

Column space:

A basis for the column space of a matrix A consists of the column vectors with leading 1s in $\text{rref}(A)$.

1.1.2 Extending a Basis

:o

1.2 Inner Product Spaces (4.11)

March 24, 2014

1.2.1 Axioms

4 Axioms of an Inner Product

1. $\langle \mathbf{V}_1, \mathbf{V}_1 \rangle \geq 0$ and $\langle \mathbf{V}_1, \mathbf{V}_1 \rangle = 0 \iff \mathbf{V}_1 = \mathbf{0}$
 Check that the scalar result is positive or zero.
 Show that $\langle \mathbf{A}, \mathbf{A} \rangle = 0$ forces the coefficients to be zero.
2. $\langle \mathbf{V}_1, \mathbf{V}_2 \rangle = \langle \mathbf{V}_2, \mathbf{V}_1 \rangle$
3. $\langle c\mathbf{V}_1, \mathbf{V}_2 \rangle = c\langle \mathbf{V}_1, \mathbf{V}_2 \rangle$
4. $\langle \mathbf{V}_1, \mathbf{V}_2 + \mathbf{V}_3 \rangle = \langle \mathbf{V}_1, \mathbf{V}_2 \rangle + \langle \mathbf{V}_1, \mathbf{V}_3 \rangle$

1.2.2 Orthogonality

Two vectors \mathbf{p} and \mathbf{q} are defined to be orthogonal if $\langle \mathbf{p}, \mathbf{q} \rangle = 0$.

1.2.3 The Gram-Schmidt Process

Given a basis

$$S = \{\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n\},$$

the Gram-Schmidt process produces a corresponding orthogonal basis

$$S' = \{\mathbf{u}_1, \mathbf{u}_2, \dots, \mathbf{u}_n\}$$

that spans the same vector space as S .

S' is found using the following pattern:

$$\begin{aligned}\mathbf{u}_1 &= \mathbf{v}_1 \\ \mathbf{u}_2 &= \mathbf{v}_2 - \text{proj}_{\mathbf{u}_1} \mathbf{v}_2 \\ \mathbf{u}_3 &= \mathbf{v}_3 - \text{proj}_{\mathbf{u}_1} \mathbf{v}_3 - \text{proj}_{\mathbf{u}_2} \mathbf{v}_3\end{aligned}$$

where

$$\text{proj}_{\mathbf{u}} \mathbf{v} = (\text{scal}_{\mathbf{u}} \mathbf{v}) \frac{\mathbf{u}}{\|\mathbf{u}\|} = \frac{\langle \mathbf{v}, \mathbf{u} \rangle}{\|\mathbf{u}\|} \frac{\mathbf{u}}{\|\mathbf{u}\|} = \frac{\langle \mathbf{v}, \mathbf{u} \rangle}{\|\mathbf{u}\|^2} \mathbf{u}$$

is a vector defined as the *orthogonal projection of \mathbf{v} onto \mathbf{u}* .

Figure 1.1: Orthogonal projection of \mathbf{v}_2 onto \mathbf{u}_1

The orthogonal set S' can then be transformed into an orthonormal set S'' by simply dividing the vectors $s \in S'$ by their magnitudes. The usual definition of a vector's magnitude is

$$\|\mathbf{a}\| = \sqrt{\langle \mathbf{a}, \mathbf{a} \rangle} \text{ and } \|\mathbf{a}\|^2 = \langle \mathbf{a}, \mathbf{a} \rangle$$

As a final check, all vectors in S' should be orthogonal to each other, such that

$$\langle \mathbf{v}_i, \mathbf{v}_j \rangle = 0 \text{ when } i \neq j$$

and all vectors in S'' should be orthonormal, such that

$$\langle \mathbf{v}_i, \mathbf{v}_j \rangle = \delta_{ij}$$

1.3 Rank-Nullity and Stuff

Let A be an $m \times n$ matrix, then

$$\text{rank}(A) + \text{nullity}(A) = n \text{ (Number of columns)}$$

Similarly?

$$\dim[\text{rowspace}(A)] = \dim[\text{colspace}(A)] = \text{rank}(A)$$

However, the row space and column space are subspaces of different vector spaces.

Chapter 2

Linear Transformations

Definition: A mapping $T : V \mapsto W$ is said to be a *linear transformation* if the following properties hold:

$$\begin{aligned}T(\mathbf{u} + \mathbf{v}) &= T(\mathbf{u}) + T(\mathbf{v}) \\T(c\mathbf{v}) &= cT(\mathbf{v})\end{aligned}$$

Definition: Let $T : V \mapsto W$ be a linear transformation from one vector space to another, then

$$\text{kernel}(T) = \{\mathbf{v} \in V \mid T(\mathbf{v}) = \mathbf{0}_w\}$$
